Tables from Bryan and Morten: "The Aggregate Productivity Effects of Internal Migration"

Log average monthly wage is demeaned of year fixed effects. Unit of observation is the regency.
Regency is defined as either rural or urban to match the national share of rural.
Source: 1995 SUPAS, 2011 SUSENAS; 2012 SUSENAS.

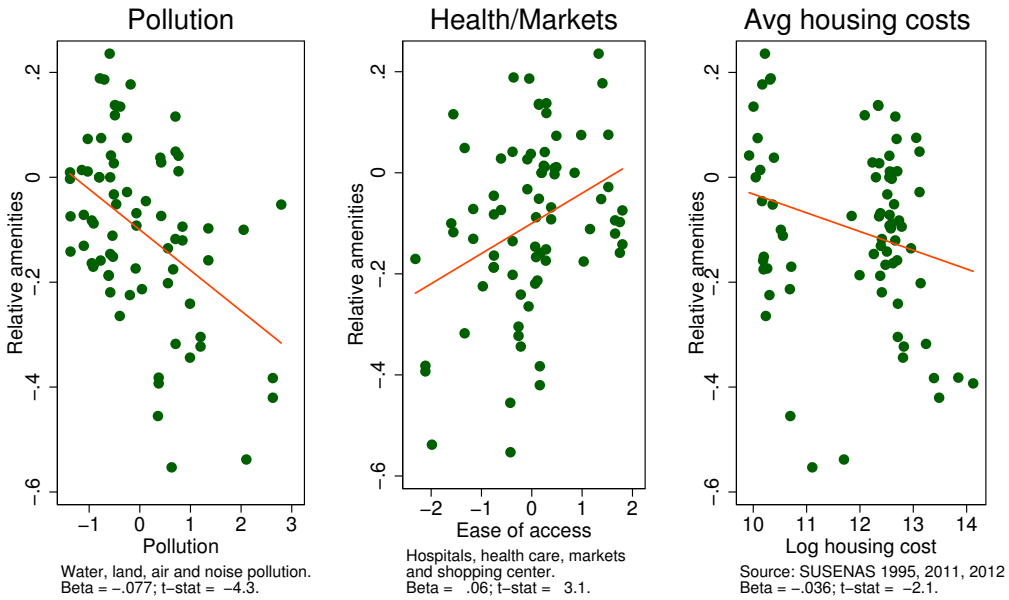

Data, demeaned by year, from 1995, 2011, 2012.
Graph shows intensive margin transport costs (less than upper bound).

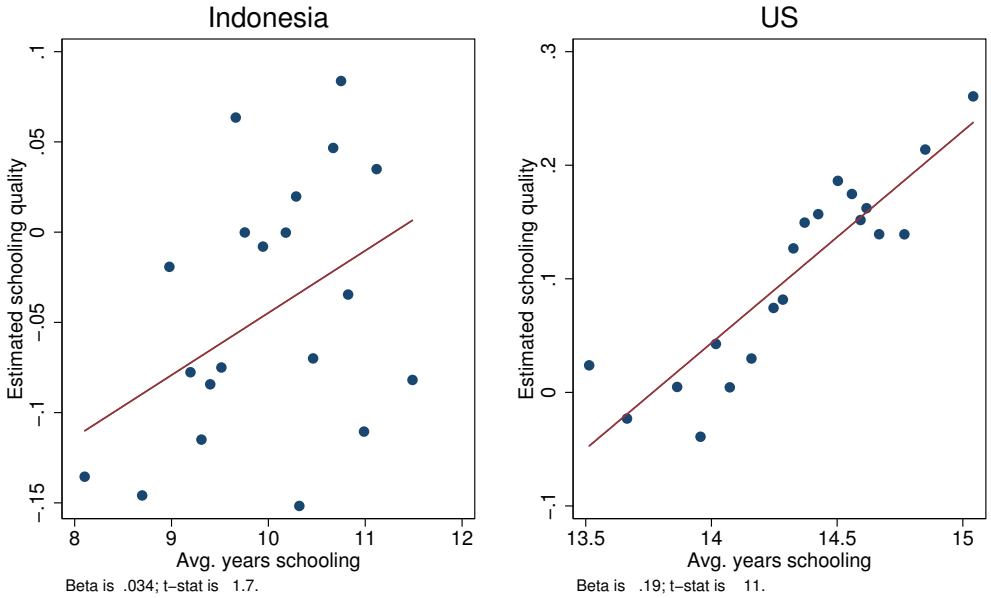

Data from 1990 and 2010 for the US; from 1995, 2011 and 2012 for Indonesia.

Correlates of estimated amenities, Indonesia

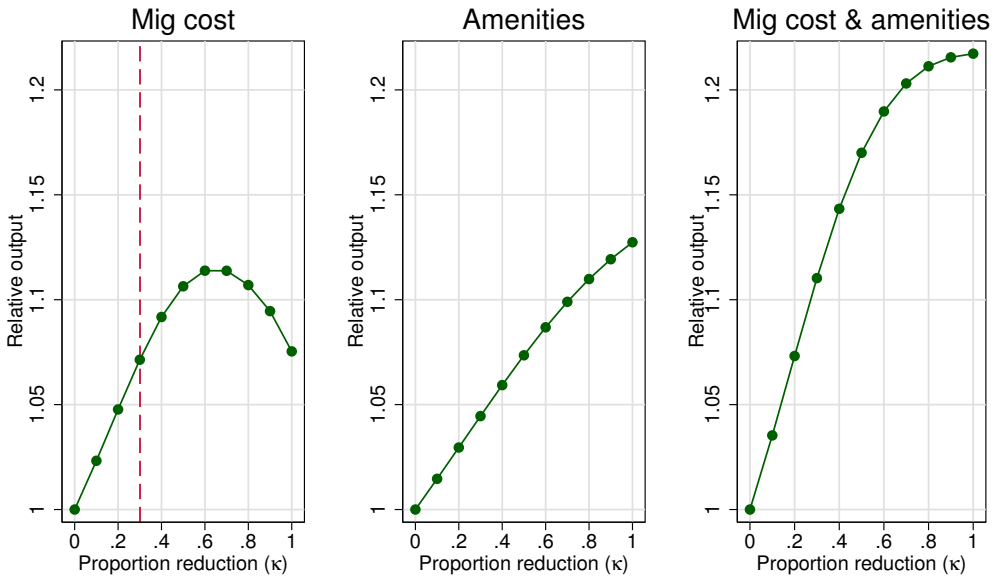

Estimated amenities from 1995, 2011, 2012.
Variable is first principal component of each group of amenities.

Estimated schooling quality against schooling attainment

Data is: 1990, 2010 for the US. 1995, 2011, 2012 for Indonesia.
Figure shows a binned scatterplot. Year effects are removed from both graphs.

Data is average across 1995, 2011, 2012 for Indonesia.
The proportion reduction, κ, is defined in the text.
The red dashed line shows the US–level of migration costs.

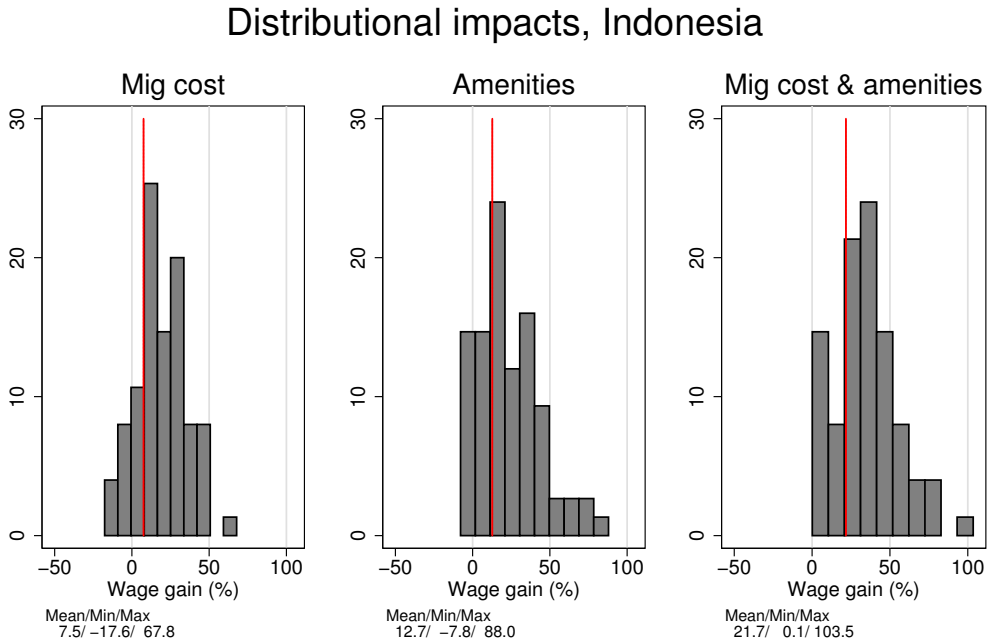

Figure shows average wage gain. The unit of observation is an origin−year.
National average (weighted by population) shown in red line.
Shows a reduction of costs of 100%. Data is 1995, 2011, 2012.

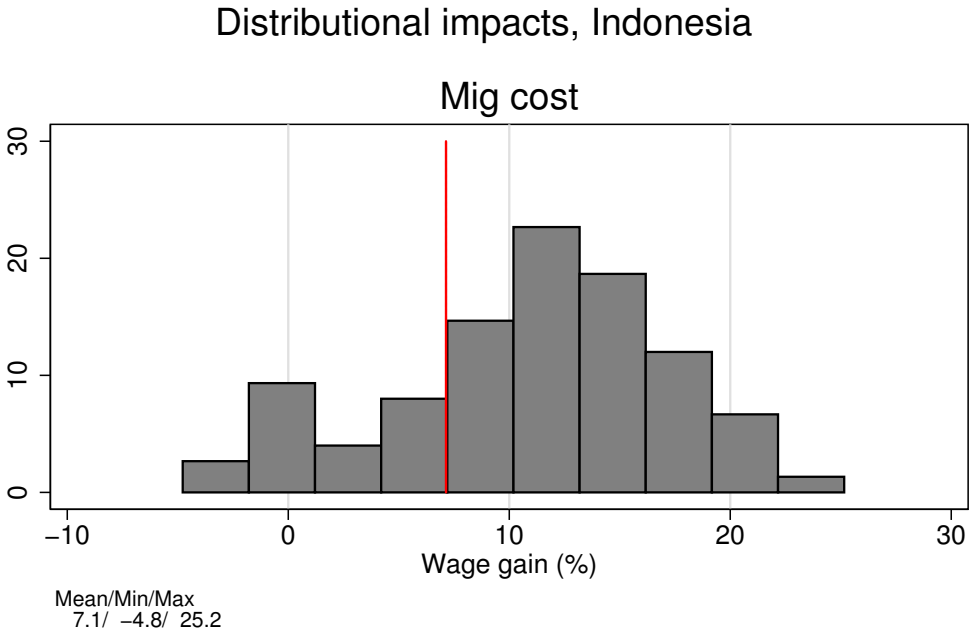

Figure shows average wage gain. The unit of observation is an origin−year.
National average (weighted by population) shown in red line.
Shows a reduction of costs of 30%. Data is 1995, 2011, 2012.

Table 1: Migration rates by origin, Indonesia

	Rural	Urban	All
1995			
Migration rate	32.3	35.8	33.7
Moves within category	31.1	74.6	49.4
2011			
Migration rate	38.7	33.7	35.7
Moves within category	24.4	84.2	58.7
2012			
Migration rate	38.9	34.1	35.8
Moves within category	25.4	83.8	60.7

Notes: Data source: 1995 Supas; 2011 Susenas; 2012 Susenas. Migration is measured as living in a regency other than the birth regency. Regencies are classified as rural or urban based on the share of their population that report being rural; we choose the cutoff to classify the regency as rural to match the national urbanization rate for each year.

Table 2: Five facts about migration in Indonesia

	Movement costs		Selection		Compensating Diff.
	(1)	(2)	(3)	(4)	(5)
Dep. variable	$\log \pi_{odt}$	$\log w_{odt}$	$\log w_{odt}$	$\log w_{odt}$	$\log w_{odt}$
Log distance	-0.717	0.029		0.007	
	(0.009)***	(0.001)***		(0.002)***	
Log share migrating			-0.039	-0.031	
			(0.001)***	(0.003)***	
Amenities					-0.023
					(0.010)**
Destination x Year FE	yes	yes	yes	yes	no
Origin x Year FE	yes	yes	yes	yes	yes
Destination FE					yes
No. of individuals	187065	186763	186763	186763	185357
No. of region pairs	25540	25244	25244	25244	25050

Notes: $\log \pi_{odt}$ is the log of the share of population migrating from o to d in year t. $\log w_{odt}$ is the log of the average wage of migrants from origin o in destination d in time t. An observation is an origin-destination regency pair. Datasource: 1995 SUSENAS, 2011 SUSENAS, 2012 SUSENAS. Two-way clustering of standard errors at the origin-year and destination-year reported in Columns (1)-(4). Clustered standard errors, at the level of the origin-year, reported in Column (5). Number of observations changes between columns because not all pairs with positive migration flows have observed wages. Amenity measure is the standardized value of the first principal component.

Table 3: Four facts about migration in the U.S.

	Movement costs		Selection	
	(1)	(2)	(3)	(4)
Dep. variable	$\log \pi_{odt}$	$\log w_{odt}$	$\log w_{odt}$	$\log w_{odt}$
Log distance	-0.553	0.023		-0.004
	(0.018)***	(0.002)***		(0.004)
Log share migrating			-0.043	-0.050
			(0.003)***	(0.006)***
Destination x Year FE	yes	yes	yes	yes
Origin x Year FE	yes	yes	yes	yes
Destination FE				
No. of individuals	2294054	2294046	2294046	2294046
No. of region pairs	5084	5076	5076	5076

Notes: $\log \pi_{odt}$ is the log of the share of population migrating from o to d in year t. $\log w_{odt}$ is the log of the average wage of migrants from origin o in destination d in time t. An observation is an origin-destination state pair. Datasource: 1990 Census, 2010 ACS. Two-way clustering of standard errors at the origin-year and destination-year reported in Columns (1)-(4). Number of observations changes between columns because not all pairs with positive migration flows have observed wages. Amenity measure is the standardized value of the first principal component.

Table 4: Estimated Frechet parameters

	(1)	(2)
	Indonesia	U.S.
ρ (correlation)	0.74***	0.90***
	(0.029)	(0.015)
θ (dispersion)	12.5***	27.6***
	(1.36)	(3.29)
$\tilde{\theta} = \theta(1-\rho)$	3.18	2.69
Mean migration cost (iceberg)	0.39	0.15

Notes: Source: estimates from structural estimation of model. Transport costs estimated non-parametrically. Bootstrapped standard errors reported.

Table 5: Output gain from reducing migration barriers

	(1) Mig costs	(2) Amenities	(3) Mig costs, amenities
Indonesia			
Baseline	1.075	1.127	1.217
No selection	0.914	1.127	1.133

Notes: Table shows the output gain from removing the barrier completely. Data is 1995, 2011, 2012 for Indonesia; 1990 and 2010 for the US. No selection recalculates the output gain shutting down the role for comparative advantage.
